

Technical

Task 1: Ideas for technical attractions

- Come up with exciting and innovative ideas for technical attractions at various DJS ACM events.
- Focus on concepts that will captivate and be memorable for the audience. Propose unique ideas with brief descriptions and necessary resources for each.

Task 2: Tinkercad task

- Car parking assist system Simulation on Tinkercad
- Use Tinkercad's virtual environment to create an Arduino circuit simulating a car parking assist system. The circuit should include 3 LEDs (red, green) and an ultrasonic sensor. Write Arduino IDE code to implement real logic – if distance is less than certain value glow red LED else the green LED should glow. This task evaluates your ability to use Tinkercad for Arduino simulations.

Task 3: Research task

- Research any one emerging hardware technology or development board (e.g., ESP32, Raspberry Pi Pico, LoRa, BLE, RFID, LiDAR, STM32, etc.).
- Summarise your research explaining what it is, how it works, its real-world applications, and why you chose it. This task evaluates your ability to learn a new technical concept, conduct independent research, and present your findings effectively.

Additional skills related to domains such as Computer Vision, Brain-Computer Interfaces (BCI), or other emerging technologies are highly appreciated.
